CirrusPRO™ New Features Guide

for build 4.12

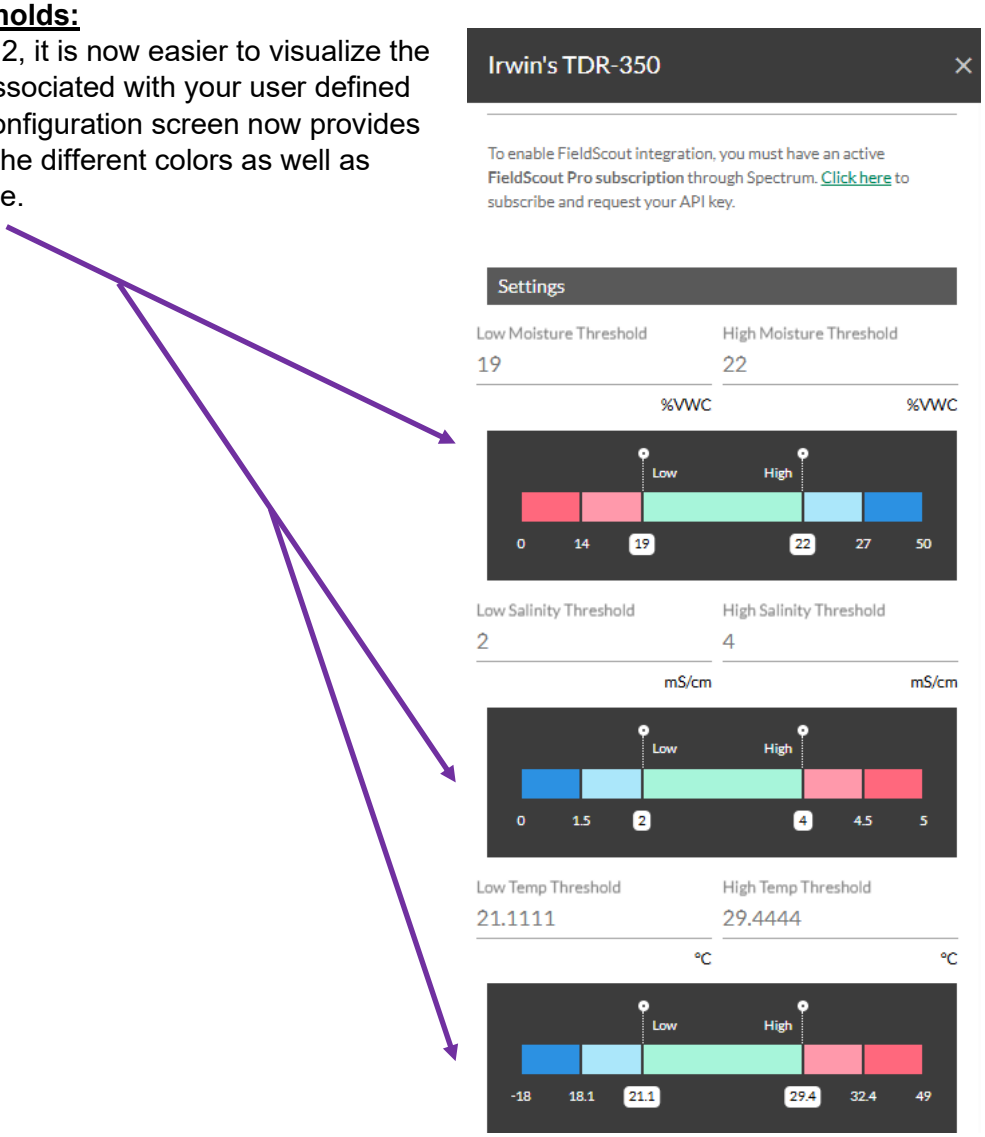

Ability to “Lock & Scroll” in the Flo-Graph:

When looking at your Flo-Graph, you can now click on a given point on one of the graph line to lock the cursor’s position, allowing you to freeze the information pop-up and then move your mouse to a different location to compare data with the locked point.

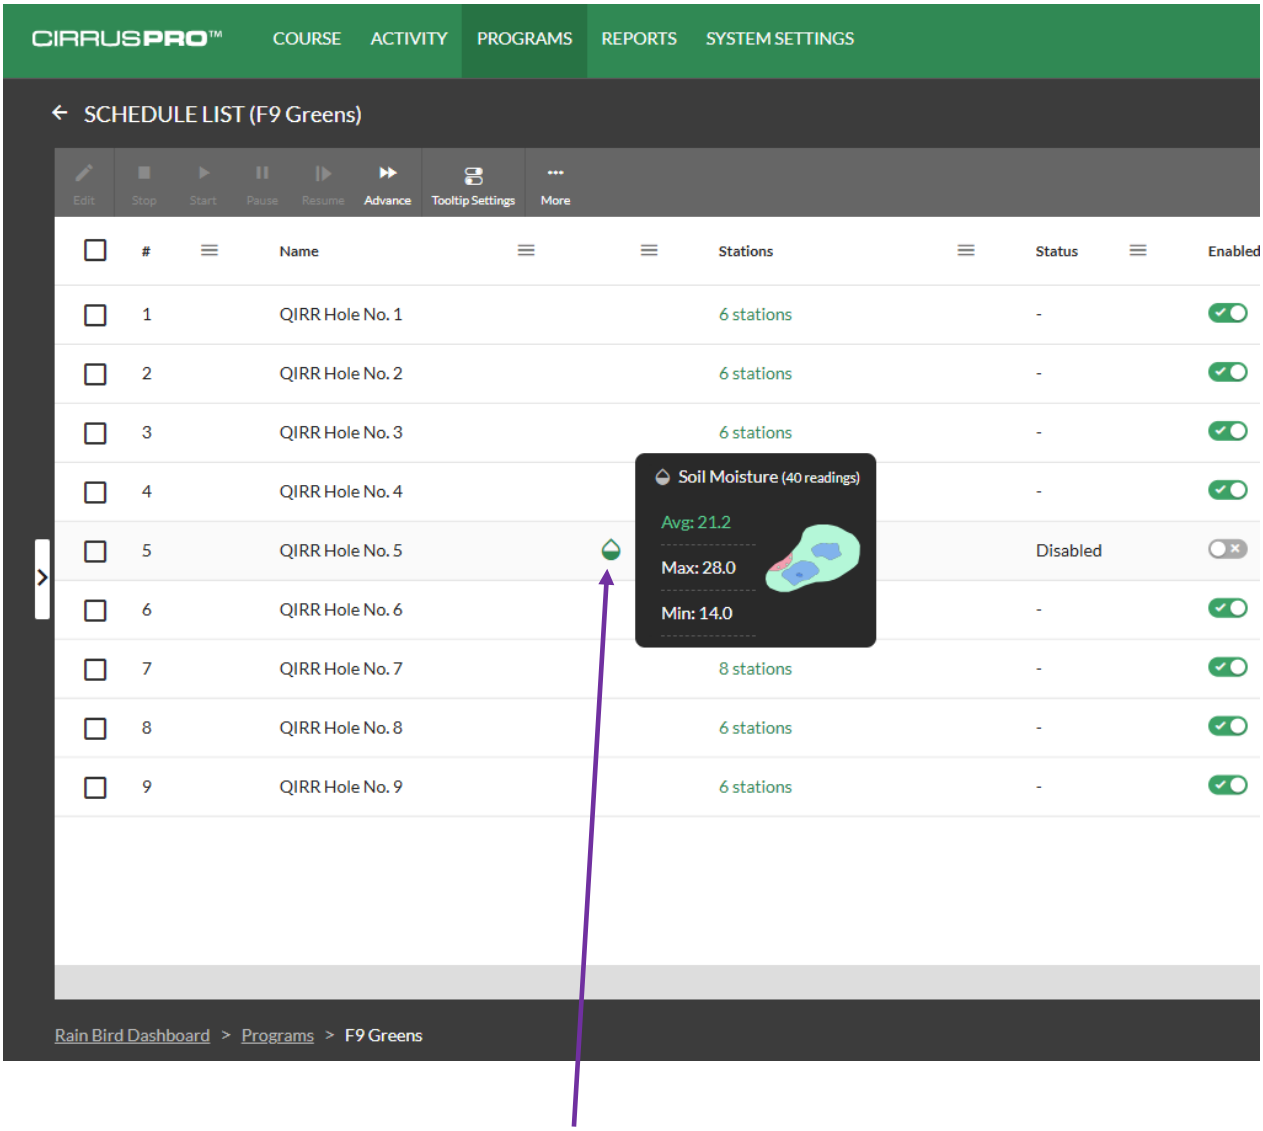

Soil Data Thresholds:

In CirrusPRO 4.12, it is now easier to visualize the colors scheme associated with your user defined settings as the configuration screen now provides graphs showing the different colors as well as when they change.

Soil Data Heatmap:

In CirrusPRO 4.12, you can now see a miniature heatmap directly in your Programs screen, at the schedule level, providing you with the ability to review the soil data heatmap in the screen where you most likely make your irrigation decisions on a daily basis. To see this new feature, navigate to your Program screen, and click on the “Schedules” link for the area where you have taken soil data points (such as the “Schedules” link next to your “Green” program).

By hovering the mouse over the soil data tooltip, a miniature heatmap will be displayed.

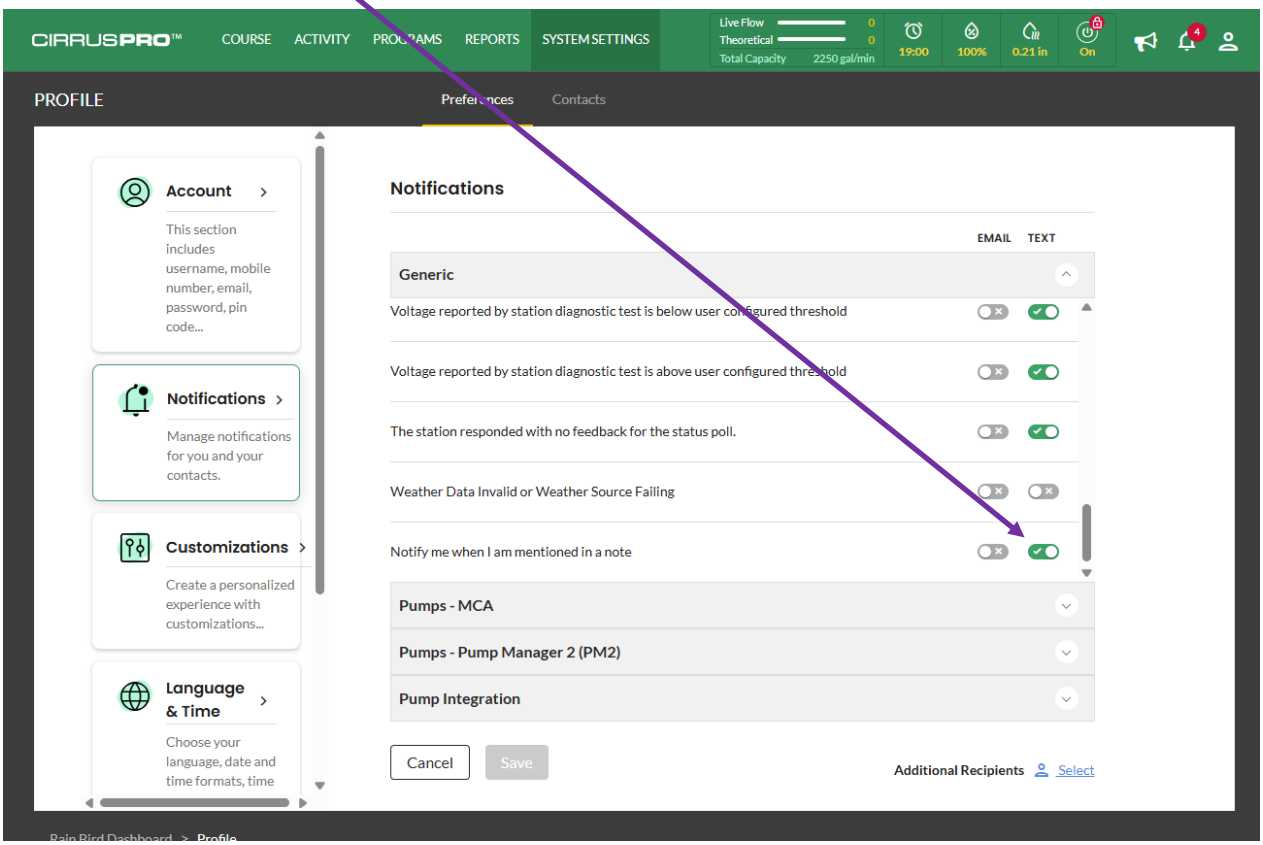

Soil Data Timestamp:

A Timestamp was added to the soil data point pop-up allowing you to see when the measurement was taken.

Text Message Notifications when @ mentioned in a Notes:

CirrusPRO now offers the ability to receive text messages when you are @ mentioned in a Note. This means that users will be notified immediately when they are assigned a Note. To activate this feature, navigate to your profile and go to the Notification menu. Open the “Generic” notification section and scroll all the way to the bottom. Then, turn on the “Notify me when I am mentioned in a note” notification via either a Text or an email (or both).

Please remember that other users must do this for their own profile if you want them to receive a notification when you @ mention them in a Note.

New Tooltips:

Two new Tooltips were added:

- One for the Maximum ET feature
- One to providing additional information when selecting “Do Not Use Flo-Manager” in the Status icon.

Updated “Software Updates” page:

The software build versions displayed in the System Settings / Admin / Software Update page are now sorted by date rather than build version.
