At Rain Bird, we believe it is our responsibility to develop products and technologies that use water efficiently. Our commitment also extends to education, training and services for our industry and our communities. The need to conserve water has never been greater. We want to do even more, and with your help, we can. Visit www.rainbird.com for more information about The Intelligent Use of Water™.
Thank you for purchasing a Rain Bird PRS-DIAL pressure regulating module to optimize the performance of your irrigation system. This product automatically maintains constant outlet pressure regardless of inlet pressure fluctuations.

Proper operation requires inlet pressure to be a minimum of 15 psi (1 bar) higher than desired outlet pressure. This product is designed for use with Rain Bird PGA, PEB, PE81R, PE81R-2, EFB-CP and BPES commercial valves. Much of the installation is done by hand; elsewhere, an adjustable wrench and pressure hose gauge are required.

As with all pressure regulators, this product senses back pressure before regulating outlet pressure. When opening the valve, it is normal for outlet pressure to momentarily exceed the desired set pressure and then begin regulating outlet pressure. This situation can be greatly reduced by following the installation and adjustment procedures below.

### Installation
Refer to Figure 1.

1. Turn off water supply to the valve and turn flow control handle \(A\) clockwise until closed.
2. Remove solenoid \(B\) and adapter \(C\) from bonnet \(F\) with an adjustable wrench.
3. Remove the Schrader valve cap \(D\).
4. Thread PRS-DIAL housing \(E\) into valve bonnet \(F\) until hand tight.
5. Loosen slightly to align latch \(G\) between ribs on plastic valve \(H\) or hole on brass valve, then push down latch to snap in place.
6. Thread PRS-DIAL cartridge \(I\) into housing until hand tight, then thread adapter and solenoid into top of housing.
7. Keep the flow control handle closed, then turn on water supply to the valve and proceed with adjustment.

### Adjustment
Refer to Figure 1.

1. Remove the PRS-DIAL cap by pulling away from the housing. Verify setting is 100 psi (6.9 bars).
2. Attach pressure hose gauge to Schrader valve \(D\).
3. Turn solenoid counter-clockwise \(1/4\) turn to manually open the valve or activate the solenoid from the controller. Do not use external bleed.
4. Turn flow control handle counter-clockwise until pressure gauge indicates 15 psi (1 bar) above desired downstream pressure.
5. Turn PRS-DIAL adjustment knob \(J\) until pressure gauge indicates the desired outlet pressure, then replace PRS-DIAL and Schrader valve caps.
6. Turn solenoid clockwise to close the valve or deactivate the solenoid from the controller.

### Troubleshooting

#### External Leaks
Main cause is improper o-ring seal between bonnet, cartridge, adapter or solenoid.

1. Turn off water supply to the valve, then unthread parts at the leak.
2. Wipe or blow parts clean, reassemble, then turn on water supply and verify proper function.

#### Internal Leaks
Main cause is loose solenoid. If tightening solenoid does not fix the leak, proceed as follows:

1. Turn off water supply to the valve, then remove solenoid and clean debris.
2. Unthread the PRS-DIAL and check the rubber boot under the housing for tears or debris.
3. Check inside the solenoid bowl for damage to the white seat; a slight impression on top is normal.
4. Clean all parts and reassemble, then turn on water supply and verify proper function.

#### Excess Vibration
Main cause is excess air in the line or operation outside recommended flow ranges (see Table 1).

To purge the air, proceed as follows:

1. Keep water supply on.
2. PGA VALVES ONLY: remove solenoid and let water flow for two minutes.
3. ALL OTHER VALVES: remove external bleed screw and let water flow for two minutes.
4. Open and close flow control handle a few times to remove air trapped inside the bonnet.
5. Reinstall parts, follow adjustment procedures and verify proper function.

#### Schrader Valve
Main cause of failure is loose valve stem or seal failure causing external leaking.

1. Check torque of valve stem and verify that it is set at 3-5 in-lbs (0.3-0.6 Nm). Turn clockwise until tight and proper torque is achieved.
2. If the valve is still leaking, replace valve stem and turn clockwise until tight and proper torque is achieved.
